## **Introduction and Overview**

The South Carolina Marine Game Fish Tagging Program is in its 35<sup>th</sup> year with the Marine Resources Division within the South Carolina Department of Natural Resources. This year (2008) marks the fifth year that the program has limited participants to 225 trained volunteer taggers. By limiting the number of participants, the program is able to foster more meaningful interactions between participants and program staff. This ultimately increases public awareness of conservation efforts involved in the stewardship of South Carolina's natural resources. Furthermore, staff has the opportunity to effectively disseminate detailed catch reports to both the angler that tags a fish and to the angler that reports a tag recovery which reinforce the benefits of conservation efforts through catch and release. The program is constantly evolving in order to meet the changing data needs necessary to manage our marine fisheries resources and ensure that all participants realize the benefits of their contributions.

The principal funding source for the tagging program comes from revenue generated by the sale of the South Carolina Saltwater Recreational Fishing License. An annual funding proposal is submitted each year to the Saltwater Recreational Fishery Advisory Committee outlining the program objectives, goals, and budget. The committee reviews the proposal, discusses the proposed budget, and provides recommendations. Funding for the upcoming year is awarded on July 1. Additional funding comes from the occasional donations made by individuals or fishing clubs which help to further offset program costs. This year has proven to be a challenging time for the nation as a whole and SCDNR is not immune to the financial difficulties that many state agencies are currently facing. The tagging program funding was reduced to the point that made it difficult to purchase additional supplies (tags, applicators, etc.) and the lack of designated staff support continues to challenge operational capabilities.

The program is administered by SC DNR staff (Robert Wiggers, Ernest Muhammad, and Ryan Yaden), who divide their time between the tagging program and various other Marine Division programs for which they are involved.

Select marine finfish species are targeted for tag and release based on two criteria. First, they must contribute significantly to South Carolina's marine recreational fisheries. Second, specific data gaps have been identified for a particular species in regards to seasonal movements, habitat requirements, length frequency characterization, release mortality or growth data.

The following report is a summary of tagging activity for 2008.

## **Target Species**

Target species for 2008 included all species of billfish, tuna, sharks, snapper-grouper and flounder. Other specific species include black drum, bluefish, cobia, king mackerel, red drum (over 18 inches), sheepshead, tarpon, gray trout (weakfish) and Jack Crevalle. Special emphasis was placed on tagging weakfish, and this focused effort will continue.

## **Angler Awards and Overall Participation**

The tagging program presents a Conservation Award to those anglers that tag and release a minimum of 30 eligible fish within a calendar year. In addition to receiving credit for a typical tag and release, anglers also receive credit for a tag and release if they catch a fish that already has a tag (either yellow recreational or orange “DJ”) and release the fish with the tag left intact. **Species (other than weakfish) less than 12 inches in total length, non-target species, and red drum less than 18 inches are not counted towards the conservation award, although data is still utilized.**

In 2008, 13 anglers qualified for conservation awards (Table 1).

The top tagger for 2008 was Mr. John Dunphy with 417 fish tagged and released. The majority of John’s fish were tagged off Fripp Island in Beaufort County. His top three species tagged were weakfish (151), red drum (133), and black drum (58). In addition, John made a significant contribution by utilizing t-bar tags to focus additional tagging effort on weakfish as part of a separate study.

The second top tagger spot went to Mr. John Ward with a total of 185 fish tagged and released. His top three tagged fish were requiem sharks (32), red drum (32), and black seabass (18). The majority of John’s tagging effort was concentrated in the Kiawah River and adjacent creeks.

The programs’ number three spot was occupied by Mr. Gary DenBraven. Gary tagged a total of 107 fish in 2008, all of which were tagged and released off the Surfside Pier in Myrtle Beach. His top three fish tagged were requiem sharks (80), bluefish (10) and weakfish (7). Gary is a fixture on the Surfside Pier and has been part of the programs’ core tagging group for almost two decades. This makes the second year that Gary has taken the third top angler spot.

Out of the 220 trained taggers, 47% tagged at least one fish (Table 2). However, only 39% of the 3,440 tags issued to program participants in 2008 have yet to be received back in the form of tag cards detailing the initial tag event.

## **Program Operation and Management**

The key to success for the public tagging program is keeping the number of participants at a manageable number. This allows for a much easier means in which to communicate and provide feedback to program participants.

Anglers wishing to participate in the program are required to attend a workshop before being issued tags and equipment. Once certified, anglers are not required to attend another workshop but must renew their registration each year in order to continue receiving tags; however, experienced taggers are encouraged to attend another workshop. This provides an opportunity to share information and suggestions gained from actual experience tagging and releasing different species.

Anglers that express an interest in participating, after the workshop series has been completed, are added to a mailing list to be notified regarding the schedule for the upcoming year. Letters are typically sent out a month prior to the first scheduled workshop, and anglers must pre-register for the workshop they plan to attend. Workshops focus on training anglers the proper techniques used in handling, tagging, venting, and releasing marine game fish in addition to providing an overview of the programs' tag and recapture database. The two hour workshop is divided into two parts; a presentation, followed by "hands-on" tagging where participants have the opportunity to practice tagging on dead fish. The practice tagging proves invaluable in helping anglers to hone their tagging technique before placing a tag in a live fish.

## **Tagging Equipment**

Yellow nylon dart tags (Figure 1) have proven to have good tag retention and are relatively easy to apply. Three sizes of tags are used depending on the species and size of fish being tagged. The smallest tags measure 9.5 cm (3.75 in.) and are used on fish between 12 and 27 inches. The next size measures 14.5 cm (5.75 in.) and is used on fish over 27 inches. The largest tag is a stainless steel harpoon tag specifically for tagging sharks and billfish. Unlike dart tags, the harpoon tag is designed to embed in the muscle of the fish as opposed to locking between spines. Applicators for the nylon dart tags are stainless canulas imbedded in a wooden dowel. A stainless slotted tip is provided to anglers for use with the harpoon tag along with instructions for building a tag stick.

The reasons for utilizing these tag types are primarily the low cost and ease of application requiring a minimum amount of instruction.

Each tag has a corresponding postage paid information card (Figure 2) where anglers report the necessary information about the tag event. Size information, primarily in the form of **total length measurements**, is important in determining length frequency characterization of discards, and anglers are strongly encouraged to record accurate measurements of the fish they are tagging.

## **2008 Tag and Recapture Data**

Compared to 2007 (2,797 fish tagged), 2008 showed a decrease in tagging activity with 1,526 fish being tagged and released (Table 3). This decrease can mainly be attributed to supply shortages (tags) that could not be replenished in order to supply participants with additional tags. There were 229 recaptures reported in 2008 (Table 4) of which 72% were re-released with the tag still intact. The practice of releasing tagged fish with the tag still intact is strongly encouraged and heavily promoted as it allows for obtaining additional data. Multiple recaptures increase the level of precision in identifying patterns of movement among different species as well as more accurate growth rates.

Out of the 229 reported recaptures there were 36 that had no associated initial tag information.

### **Black Drum**

There were 98 black drum tagged in 2008, which is a slight decrease than last year (146). Of those, 54% were caught and tagged within 3 miles of the South Carolina coast (State waters). Forty-seven percent were tagged offshore on reefs. Fish ranged in size from 12 to 35 inches with an average size of 16 inches.

Eleven (11) black drum recaptures were reported in 2008, 2 of which were re-released. Again this year, there was no significant movement documented, and the majority (91%) had been tagged in 2008. This represents an annual recapture rate of 11% compared to last year's annual recapture rate of 12%.

### **Black Sea Bass**

In 2008, 95 black sea bass were tagged and released. We have seen yearly increases in tagging activity for black sea bass since 2005 (10) and 2006 (98). Ninety-five percent of these tagged fish were caught offshore (beyond 3 miles) of South Carolina. The average size of a tagged fish was 12.5 inches.

Twenty (20) black sea bass recaptures were reported. There was no significant movement of fish from the original tagging site. Out of 20 recaptures, all were re-released except for 4 that were retained and 1 re-released without a tag.

### **Bluefish**

Twenty-four (24) bluefish (average size of 14 inches) were tagged in 2008 with no reported recaptures. The overall recapture rate for bluefish in this program is about 2%. Past tagging activity in the spring off of South Carolina tends to result in tag recaptures primarily to the north, with documented movement as far north as Maryland. Bluefish tagged later in the year have shown a marked southerly movement and have been recaptured as far south as Stuart, Florida.

## **Cobia**

Eighteen (18) cobia were tagged and released in 2008. Two (11%) of these were tagged in the Broad River during May and June. Ten (10) fish were tagged and released off Florida's east coast, and six (6) fish were tagged on artificial reefs off South Carolina. The average size tagged and released was 32 inches.

There were 16 cobia recaptured in 2008, 87% of which were retained. Seven (7) fish were at liberty for more than 300 days. The majority of recaptures occurred within close proximity of the initial tagging site. We had two cobia tagged in the Broad River and later recaptured off of Florida. In particular, one of these cobia was tagged on 4/23/06 and recaptured off Florida on 3/13/2008 (at liberty for 690 days) and had grown 14.5 inches and 14.6 pounds.

We also this year had two cobia that were at liberty over 1000 days. One cobia was tagged in the Port Royal Sound area on 6/29/2004 and was recaptured in Old House Creek on 5/27/2008. This cobia was at liberty for 1428 days and grew 3 inches and 20 pounds. The other cobia was tagged on 7/27/2004 at the Fish American Reef and recaptured on 5/23/2008 in Oyster Creek (at liberty for 1396 days). It had grown 19 inches. All of the mentioned recaptures were retained.

## **Flounder**

Seventy-seven (77) flounder were tagged in 2008. A little over one quarter (26%) was not identified to species on the tag information card, but of those that were, 9 were identified as summer flounder and 48 identified as southern flounder. All three species of *paralichthid* flounders (southern, summer and Gulf) are found in South Carolina with the southern being the most commonly encountered of the three. Based on this fact, it is believed that the majority of species unidentified were southern flounder. Tagging activity for flounder occurred primarily in the coastal areas north of Georgetown around the following locations (# tagged): Hog Inlet (11), Murrells Inlet (29) and Surfside Pier (6). The average size of flounder tagged and released was around 13 inches.

Overall, nine (9) flounder were recaptured in 2008, of which 5 were retained. Recaptures occurred in the same area as the initial tagging event. The maximum days at large (DAL) was documented at 216 days. This fish was originally tagged in Main Creek on 10/19/2007 and was recaptured on 5/22/2008 in Murrells Inlet. It grew 3.75 inches. Since 1989 the tagging program has documented 501 flounder recaptures (8% overall recapture rate) with an average DAL of about three months and the longest DAL documented at 1,834 days.

## **King Mackerel**

Between July and August of 2008, 10 king mackerel were tagged and released. All were tagged off South Carolina. The average size of fish tagged was 33 inches with an average weight of 9 pounds. There were no reported recaptures for 2008 which is typical for a species with a historically low recapture rate (around 2%).

## **Red Drum**

Tagging effort of red drum during 2008 was similar to that seen in years past. Seven-hundred and twelve (712) fish were tagged, ranging in size from 11 inches to 48 inches. Red drum made up 47% of the total number of fish tagged in 2008, with most of the tagging effort focusing in and around the Charleston area.

In the southern coastal region (Beaufort, Colleton counties), the primary areas where red drum were tagged included (number tagged): Trenchard's Inlet/ Skull Creek (54), Broad Creek/ Old House Creek (59), Chechessee River (4), and Fripp Dry Dock (14). In the central coastal region (Charleston, Berkley counties): Wando River (57), Charleston Harbor and adjacent areas (122), and Ashley River and Cooper River (32). Top tagging locations in the northern coastal region (Georgetown, Horry counties) include Winyah Bay and adjacent areas (49) and the Sampit River (5).

Red drum are truly indicative of the program's conservation focused directives. During 2008, 479 fish (67%) were tagged and released that were within the legal slot limit (**which on 1 July 2007 went to 3 fish between 15 and 23 inches**) and could have potentially been retained. These recaptures provide proof to anglers of the benefits of practicing catch and release.

During 2008 there were 148 reported recaptures of red drum with 84% being re-released. Seventeen (8) were recaptured twice, two (2) were recaptured three times and one (1) recaptured four times in the same year. Nineteen recaptures had no initial tagging information associated with them.

There are two outstanding recaptures of red drum in 2008 that need recognition. A red drum tagged and released on 4/9/07 has been recaptured and re-released a total of 6 times that includes its most recent recapture on 11/08/08. The initial tagging event and all of the recaptures have occurred in the Sullivan's Island area. This fish is a perfect example of some species affinity to a particular site, called site fidelity. Another red drum was tagged in Wappoo Cut on 2/27/97 and was recaptured and re-released in the Winyah Jetties, about 55 miles away, on 10/05/08. This fish has been at liberty for 11 years (4,238 days).

In most cases, red drum are recaptured within close proximity of the initial tag location which supports strong site fidelity of sub-adult fish.

## **Billfish**

Due to potential tag induced mortality, consistently low recapture rates (less than 1%), and the benefits of using satellite tags (although extremely expensive at around \$3,000 apiece), there has been little promotional effort from the MGFTP in encouraging billfish tagging with archival tags. As a result only 10 billfish were tagged during 2008. Twenty-four (8) sailfish and 2 blue marlin. No sailfish were recaptured in 2008.

## **Sharks**

Anglers are encouraged to tag and release sharks provided it can be done safely and the tagger can make a positive identification of the shark they plan to tag. For this reason, it is recommended that certified taggers spend some time referencing shark identification guides, or contact program staff in order to become more familiar with identifying species characteristics.

Two-hundred and thirty (230) sharks, encompassing a variety of species, were tagged and released during 2008. The majority (56%) were small coastal species (Atlantic Sharpnose (67) and Bonnetheads (61)), which is not surprising since these are the most frequently encountered species by recreational anglers. The top two large coastal species tagged and released were (# tagged): Blacktip (9) and lemon (4).

Again this year, Atlantic Sharpnose (29%) made up most of the total number of sharks tagged and released in 2008; Primary tagging sites (number tagged) included: Colleton River (12), Surfside Pier (11), and Winyah Bay (11). One (1) Atlantic Sharpnose was recaptured which represents a 2% annual recapture rate.

There were 61 Bonnethead sharks tagged in 2008. Sixty-three (63%) of these were tagged in the Kiawah River around Mullet Hall and Haulover Creek. Average size of tagged bonnetheads was around 36 inches. There were six (6) recaptures (all re-released), one of which was at large for over two years (773). This fish was originally tagged on 7/5/06 and was recaptured for the second time on 8/16/08 in the same area it was tagged, Haulover Creek.

Sixty-seven (78) dogfish (19 spiny, 59 smooth) were tagged and released. All of the smooth dogfish were tagged off of Surfside Pier, all of which were tagged by Gary DenBraven. There were 1 dogfish recaptured (1 smooth, 0 spiny).

## **Sheepshead**

Sheepshead continue to become an increasingly popular species targeted by recreational anglers, and during 2008 participants tagged and released one hundred seventy one (171) fish. The average size tagged was 13.4 inches. Most of the tagging activity this year occurred between January and May. Top tagging locations (number tagged) included: Charleston Jetties (26) and Winyah Jetties (22).

Five (5) sheepshead were reported recaptured during 2008, 40% of which had been tagged within the same year. This represents an annual recapture rate of 3% which is considerably lower than the programs' cumulative rate which is around 12%. The average days at large was 136 days with the longest time at large 360 days. An examination of recapture locations versus initial tag locations reveals the seasonal movement patterns of fish moving from inshore to slightly offshore (mostly nearshore artificial reefs) as water temperature cools in the late Fall.

## **Snapper-Grouper**

Tagging effort on snapper-grouper complex species is primarily focused on undersized fish, and these species typically represent less than 7% of the total number of fish tagged as part of the program. During 2008, 62 snapper-grouper complex species (excluding black sea bass, sheepshead, and spadefish) were tagged and released. The top species tagged (number tagged) (average size) were red snapper (17) (18 inches TL), gag grouper (24) (17 inches TL), and White Grunt (8) (15 inches TL).

We had five (5) reported recaptures out of this group which includes the following: an unknown grouper (1), Scamp (2), and Red Snapper (2).

As with most snapper-grouper species that are tagged as part of this project, it is difficult to document movement since location information for both the initial tag and recapture event is often generalized (partial coordinates). Anglers may feel that by providing specific location information they are compromising their fishing spot. Regardless, the tag and subsequent recapture of species caught in deep water can provide some insight into post release survival rates.

## Spadefish

There were only 4 spadefish tagged in 2008 all of which were tagged during June. All were tagged and released at the Georgetown Nearshore Reef and the average size was 13 inches.

There were no reported recaptures of Spadefish in 2008.

## Weakfish

**Figure 1. Comparison of weakfish, *Cynoscion regalis* (bottom) and Spotted Seatrout *Cynoscion nebulosus* (top).**

In order to gain a better understanding of the weakfish fishery off South Carolina and document the correlation to that of the overall Atlantic coast weakfish stock, a focused tag and release effort was undertaken in 2005. Through 2008, 931 weakfish have been tagged and released.

Weakfish continue to be a priority species for the public tagging program and fish are tagged by both certified taggers and program staff using either dart or t-bar tags. In an effort to get more fish tagged, two certified taggers (John Dunphy and John Ward) were supplied with a tagging gun and t-bar tags and recorded pertinent information on data sheets. Overall, during 2008, 201 weakfish were tagged with t-bar tags and 42 were tagged with small nylon dart tags.

Overall, the average size of weakfish tagged and released ( $n=77$ ) was 14.5 inches with a size range between 11 and 22 inches.

Tagging locations (number tagged) for weakfish, based on the total tagged, were: Fripp Dry Dock (26), Surfside Beach (7), Edisto Nearshore Reef (1), Georgetown Nearshore (1), Charleston Harbor/Jetties (1), Lowcountry Anglers Reef (1), Main Creek (1) and Lawrence Wreck (1).

No weakfish were recaptured during 2008.

T-bar tags were inserted using a tagging gun (Avery Dennison Swiftach®) shown in Figure 4. This is an extremely efficient tool for tagging fish quickly and is more “fish friendly” than the dart applicator, but at a cost of about \$43 per gun is cost prohibitive for a program operating with a limited budget.

### **Acknowledgements**

Although there were no workshops held during 2008, staff would like to thank all volunteers that attended workshops in 2005 and 2006 and became “certified taggers”. We appreciate the time that you have taken to help out with this project.

Thanks to all anglers that took the time to report the recapture of a tagged fish. The cooperation of the angling public is a vital component to the success of any tag and release study and we greatly appreciate this contribution.

Thanks to Al Oswald and the members of The Saltwater Sports Club of James Island for their donation in 2008 and their consistent support of the MGFTP.
